

## Help Sheet – Adding and Subtracting multiples of 100

This is called Base 10.

Equations are number sentences or calculations.

$$100 + 300 = 400$$

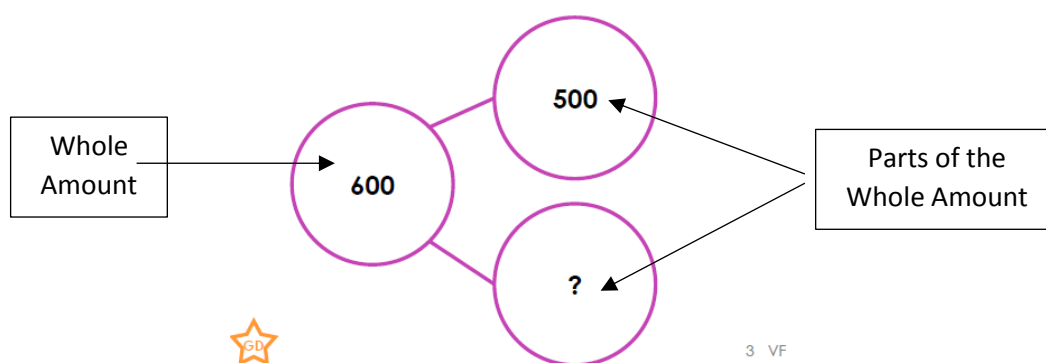

$$400 = 100 + 300$$

**Do not be put off  
by the = being  
'before' the  
calculation.**

**= means equal to. So 400 equals ('is the same as') the answer to 100 + 300.**

This is called a 'Whole Part Model'

- Finding doing these calculations difficult? Write the calculation in a column.
- When trying to find all possible equations (number sentences), write out the number cards onto bits of paper and try moving them around physically.
- Values means 'digits or numbers'. Instead of using a missing number box or a questions mark, letters are used. When trying to find missing numbers you may need to just try any number thinking about the clues in the other numbers you have been given.
- Explain – make sure you use your maths language to explain how someone knows or what mistake someone has made.
- More than 1 step? Break it down and do one at a time
